ABSTRACT

The main objective of our project is to provide more security while performing online transaction by providing efficient authentication etc. In the existing system, we can perform all the operations using a single user id and password. Once this password is stolen, it is easy for the others to access all the operations like transfer of money etc., so that the customer could pay a huge loss. Thus it is not secured up to mark. In our project, we provide much security to the customer while using the online banking service in the following ways. The customer using the online banking service would be given user id along with two other passwords. One called Login Password and the other called transaction password. By using login password the customer can login to be account and we can perform only some (limited) operations like viewing A/C balance and personal details etc. But to perform transfer or online transaction, the user needs to provide the transaction password and other secure information in order to complete the transaction successful.

If the customer login password and id is stolen by someone else, he can see the details but he can't perform online transaction or transfer. Apart from the transaction password the customer needs to get verified by providing the grid values present on is debit card which would be asked randomly. So there is no chance for the person whose steals the password details to make transaction because he also needs to enter the values which are present on the customer's debit card.

Number of Modules:

The system after careful analysis has been identified to be presented with the following modules: The Modules involved are

1. Admin.

2. User
3. Registration
4. Security and Authentication

SOFTWARE DEVELOPMENT METHODOLOGY:

The methodology used to develop this project is object-oriented methodology is based on function and procedures. It can be said as the development of software by building self-contained modules as objects that can be easily replaced, modified and reused. In this environment software is a collection of discrete objects that encapsulate their data as well as the functionality to model real world “objects”. Each object has attribute and methods. Objects are grouped into classes. Here each object is responsible for itself.

This environment emphasizes its cooperative philosophy by allocating tasks among the objects of the applications. Instead of writing a lot of code we can create a lot of code we can create a lot of helps to take in an active role.

Object oriented methodology involves mainly

1. Analysis

2. Design

3. Prototyping and testing.

ANALYSIS:

There are 5 important steps in the analysis. They are

1. Identification of the users/actors.
2. Development a simple business process model.
3. Developing the use cases.
4. Developing the interaction diagrams.

5. Classifications.

.

INTRODUCTION:

In 1986 BOOCH developed the Object Oriented Design concept is called as BOOTCH METHOD. It covers both analysis and Design phases of the Object Oriented System, The BOOTCH METHOD consists o following diagrams:

- Class diagrams
- Object diagrams
- State transition diagram
- Module diagram
- Process diagram
- Interaction diagram

BOOTCH used the large set of symbols. Even though BOOTCH defines a lot of symbols to document almost every design decision, if we work with his method, you will notice that you never use all these symbols and diagrams; this is this main drawback of the BOOTCH METHOD. In 1991 Jim Raumbaugh develop the OMT (Object Modeling Technique) with the help of his team It covers analysis, Design and implementation of the system.

OMT separates Modeling into three different parts:

- Object Model

  Presented by the Object Model and the data dictionary.
- Dynamic model

  Presented by the State diagrams and Event flow diagrams.
- Functional Model

Presented by Data flow and constraints.

There is no traceability in the different phases, both forward and back ward; this is the main disadvantage of the OMT.

In order to avoid the problems faced in the above two models JACOBSON invented the one model called as the JACOBSON METHDOLOGIES (Object Oriented Software Engineering). It will cover the entire life cycle and stress tractability between different phases, 0both forward and back ward, Additionally he invented the Use case diagrams, these diagrams are necessary to understanding system requirement. It captures the goal of the system. It is used to identify the Use cases and External users (external users are the users who interact with our system to complete the task)

Acronyms and Abbreviations:

ACC:Account

Pwd:password

Uid:user id

Facc:From Account

Tacc:To Account

Overall Description:

Specification requirements:

Software requirements:

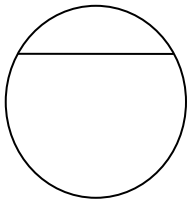
- Data Base : SQL Server 2005

Data Flow Diagrams

DFD SYMBOLS:

In the DFD, there are four symbols

1. A square defines a source(originator) or destination of system data
2. An arrow identifies data flow. It is the pipeline through which the information flows
3. A circle or a bubble represents a process that transforms incoming data flow into outgoing data flows.
4. An open rectangle is a data store, data at rest or a temporary repository of data



Process that transforms data flow.

Source or Destination of data

System Testing and Implementation

Sample Code

Transfer:

```
SqlConnection con = new SqlConnection("user
id=sa;password=amith;database=bank");
        SqlCommand cmd;
        SqlDataReader dr;
        int curbal = 0;
        cmd = new SqlCommand("select userbalance from customer where userid =
'"+Session["uname"].ToString()+"'",con);
        con.Open();
        dr = cmd.ExecuteReader();

        if (dr.Read())
        {

            curbal = Convert.ToInt32(dr[0].ToString());
        }
        con.Close();

        if (Convert.ToInt32(TextBox2.Text) > curbal)
        {
            Label1.Text = "Insufficient balance";
        }
        else
        {
            cmd = new SqlCommand("select tpwd from login where userid='" +
Session["uname"].ToString() + "'", con);
            con.Open();
            dr = cmd.ExecuteReader();
            if (dr.Read())
            {
                if (TextBox3.Text == dr[0].ToString())
                {
                    Session["a"] = TextBox1.Text;
                    Session["b"] = TextBox2.Text;
                    Session["c"] = curbal;
                    //Session["uname"] = TextBox1.Text;
                    Response.Redirect("gridform.aspx");
                }

                else
                {
                    Label1.Text = "Invalid Transaction Password";
```

```
                }

            }

            con.Close();
        }
    }
```

Register:

```
        da = new SqlDataAdapter("select accno from customer",con);
        DataSet ds = new DataSet();
        da.Fill(ds,"x");
        if (ds.Tables[0].Rows.Count == 0)
        {
            nacno = "10000001";
            TextBox1.Text = nacno;
        }
        else
        {
            int k = ds.Tables[0].Rows.Count;

            string acno = ds.Tables[0].Rows[k - 1].ItemArray[0].ToString();
            nacno = (Convert.ToInt32(acno) + 1).ToString();
            TextBox1.Text = nacno;
        }
    }
    protected void Button1_Click(object sender, EventArgs e)
    {
        if (RadioButton1.Checked)
        {
            gender = "Male";
        }
        else
        {
            gender = "Female";
        }

        string db = DropDownList1.SelectedItem.ToString() + "/" +
DropDownList2.SelectedItem.ToString() + "/" +
DropDownList3.SelectedItem.ToString();

        con.Open();

        cmd = new SqlCommand("insert into customer
values('"+TextBox1.Text+"','"+TextBox2.Text+"','"+TextBox3.Text+"','"+gender+
"','"+db+"','"+TextBox4.Text+"','"+TextBox5.Text+"','"+TextBox6.Text+"','"+Te
xtBox7.Text+"','"+TextBox8.Text+"','"+TextBox9.Text+"','"+TextBox10.Text+"','
"+TextBox11.Text+"')", con);
        cmd.ExecuteNonQuery();
        con.Close();
```

```
        Random r = new Random();
        string[] grid = new string[6];
        for (int i = 0; i < 6; i++)
        {
            grid[i] = r.Next(10,99).ToString();
        }
        con.Open();
        cmd = new SqlCommand("insert into login values('" + TextBox11.Text +
"','" + TextBox11.Text + "','" + TextBox11.Text + "','" + grid[0] + "','" +
grid[1] + "','" + grid[2] + "','" + grid[3] + "','" + grid[4] + "','" +
grid[5] + "')", con);
        cmd.ExecuteNonQuery();
        con.Close();
        Label1.Text = "Registration Successfully completed";
        TextBox1.Text = "";
        TextBox2.Text = "";
        TextBox3.Text = "";
        TextBox4.Text = "";
        TextBox5.Text = "";
        TextBox6.Text = "";
        TextBox7.Text = "";
        TextBox8.Text = "";
        TextBox9.Text = "";
        TextBox10.Text = "";
        TextBox11.Text = "";

                    }

}
```

View Transactions:

```
protected void Page_Load(object sender, EventArgs e)
    {
        SqlConnection con = new SqlConnection("user
id=sa;password=amith;database=bank");
        SqlDataAdapter da = new SqlDataAdapter("Select * from [transaction]
where facc = '" + Session["uname"].ToString() + "'", con);
        DataSet ds = new DataSet();
        da.Fill(ds);
        GridView1.DataSource = ds.Tables[0];
        GridView1.DataBind();
    }
```

Conclusion:

Here we provide security and authentication for the online banking account ,the customer using the online banking service would be given user id along with two other passwords. One called Login Password and the other called transaction password. By using login password the customer can login to be account and we can perform only some (limited) operations like viewing A/C balance and personal details etc. But to perform transfer or online transaction, the user needs to provide the transaction password and other secure information in order to complete the transaction successful.
